Aniline is chiefly used in the colour industry. In the laboratory it is frequently employed as a solvent, since it dissolves many substances--e. g. indigo-blue--which are insoluble in the ordinary reagents. SALTS OF ANILINE. 1027 Although its basic properties are feeble, aniline combines with acids, forming well-crystallizable salts. Hence Unverdorben, as has been already remarked, gave to it the name of crystalline. The salts of aniline have been carefully examined, but we shall here only refer to those which have received technical applications, or are specially characteristic. Aniline hydrochloride, $C_6H_7N \cdot ClH$, is readily soluble in water, and crystallizes in needles or large plates, which melt at 192, and sublime unchanged. It is prepared on the large scale, and generally called aniline salt; the platinum chloride, $(C_6H_7N \cdot HCl)_2PtCl_2$ crystallizes from hot water in yellow needles. Aniline sulphate, $(C_6H_7N)_2SO_4H_2$, forms a crystalline powder, readily soluble in water, slightly so in alcohol, and insoluble in ether. This last property is taken advantage of in the separation of aniline from methylaniline. Aniline nitrate, $C_6H_7N \cdot NO_3H$, crystallizes in large rhombic prisms or needles, which decompose at 190 with formation of nitraniline and other products (Bechamp). Aniline oxalate, $(C_6H_7N)_2C_2O_4H_2$, is very slightly soluble in cold water, and crystallizes from a hot solution in fine triclinic prisms; it is slightly soluble in alcohol, and insoluble in ether. 1 frmn dbomme. loc. eit. Aniline phenate, $C_6H_6 \cdot NH_2 \cdot C_6H_6O$, is formed by heating a mixture of aniline and phenol...
